

Largo Celebrity Analytics Dashboard

Implementation and Design Report

Prepared By: Hassan Shahzad

Live Application: https://hxndev.github.io/Largo_Assignment/

GitHub Repository: https://github.com/HxnDev/Largo_Assignment

Project Overview

The assignment was to recreate Largo's supplied dashboard mock-up as a simple web page populated with dummy data. I started with the original design and focused on its layout, typography, colors, controls and charts. I also made the dashboard responsive so that the layout adapts appropriately across desktop and mobile screen sizes.

Once that version was complete, I used the remaining time to build a second version with a smoother interface and a few practical features. Keeping the two versions separate allowed me to preserve the requested design while exploring improvements without changing the main submission.

Tools and Technologies used

Technology / Tool	Purpose
React	Component-based user interface and state management
Recharts	Renders the charts
Vite	Development tooling and production bundling
Mermaid	Creates architecture diagrams for the report
GitHub Pages	Static hosting for the deployed application

Development Approach with AI Collaboration

I used AI assisted development as part of my workflow. I defined the architecture, selected the technologies, established the responsibilities of each layer and decided which features belonged in the original and enhanced versions. AI assistance was primarily used for repetitive component work and code review.

Original Version

The original version is the main response to the assignment. Its purpose is to reproduce the supplied mockup while keeping the implementation straightforward. I kept the original version focused on the requested dashboard. Navigation items and report sections remain visible to match the dashboard but are disabled and display a “Yet to implement” tooltip.

Folder Structure

<i>original/</i>	Assembles the requested mockup using shared components
<i>enhanced/</i>	Adds the refined layout and enhanced interactions
<i>components/</i>	Contains presentation elements reused across both versions
<i>components/charts/</i>	Contains the four charts and their shared tooltip
<i>data/</i>	Stores mock dataset and the logic for producing filtered dummy data
<i>assets/</i>	Contains the logo and profile picture
<i>public/documents/</i>	Contains the PDF served directly when downloading the one-sheet
<i>App.jsx</i>	Selects the dashboard version and keeps that selection in the URL
<i>styles.css</i>	Defines the base styling and original dashboard layout
<i>enhanced.css</i>	Defines the enhanced layout, interactions and print styling

Component Reuse

Both versions reuse the same scorecard, awareness card, news card, chart containers and chart components. Their behavior is configured through props.

Data Layer and Contracts

I intentionally placed chart datasets, category averages and other mock data in dedicated data modules instead of embedding those values throughout dashboard markup. Components consume this data through props, keeping the data source separate from the presentation layer. This structure nevertheless gives a future integration a clear place to begin.

Enhanced Version

Once the original version was complete, I wanted to explore what could be improved while keeping the same information and Largo branding.

The enhanced version introduces more rounded cards, softer shadows, pill-shaped tabs, clearer filter controls, and more consistent spacing. The layout retains the same major sections, so switching versions makes the visual differences easy to compare.

Feature Boundaries

Feature	Original	Enhanced
Filtering	—	Yes
Date and demographic controls	Limited Behavior	Full Control
Chart hover tooltips	—	Yes
Expand Charts	—	Yes
PDF Exports	—	Browser print-to-PDF
Celebrity One-sheet download	—	Static PDF Download
Responsive Layout	Yes	Yes

Filtering

The enhanced dashboard offers three fielding dates and three audience selections:

- Total Audience
- Total Males
- Total Females

Together these provide nine combinations for exploring the dummy data. The selected date and demographic are stored in React state. When either changes, the dashboard calls `getEnhancedDataset()` to produce the relevant values.

Interactive Charts

The enhanced version uses the same Recharts components with interactions enabled. Hovering over a chart displays a tooltip with its values.

Expanded Chart View

Each enhanced chart has a working maximize button. Clicking on it records which chart is selected and opens the selected chart in a larger modal. The larger view is a separate chart instance. It uses the same data, while legend visibility remains local to each instance.

Export and Report Download

The enhanced version provides both the export as PDF functionality and download One-sheet functionality. The export button calls the browser's `window.print()` function. This opens a print dialog, where users can choose to **Save as PDF**.

The celebrity One-sheet is a dummy PDF prepared using Python's **ReportLab** package.

Hosting and Delivery

GitHub Pages fits this project because the application is static and does not require a server database. The repository contains a GitHub Actions workflow that installs the recorded dependencies, builds the application and publishes the generated files.
